Object in world coordinates (after modeling transforms)

Transform object from world coordinates to standard camera coordinates

Clip against canonical view frustum

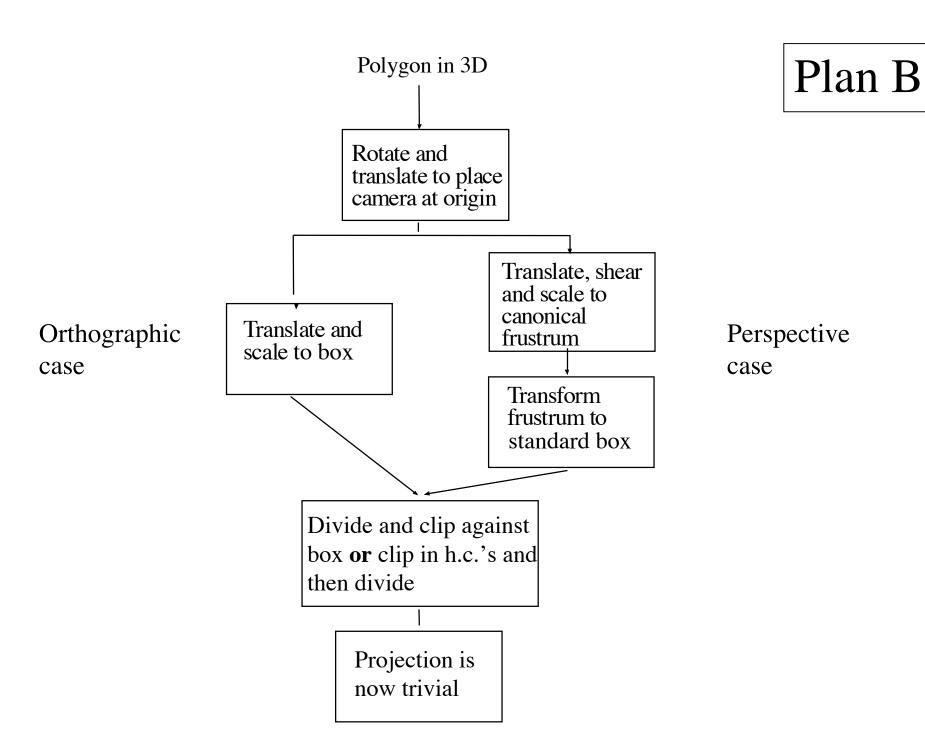

Project using standard camera model

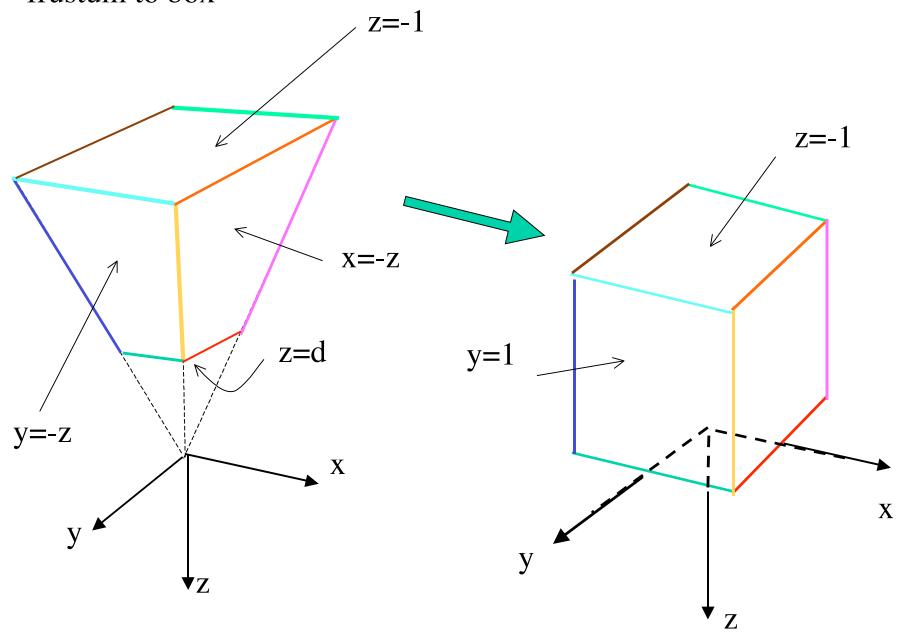

Plan A: Clip against canonical frustum (relatively easy—we chose the canonical frustum so that it would be easy!)

Plan B: Be even more clever. Further transform to cube and clip in homogenous coordinates.

Plan B: Clipping in homogenous coords

- For any camera, can turn the view frustrum into a regular parallelepiped (box). We will use the box bounded by $x = \pm 1$, $y = \pm 1$, z = -1, and z = 0.
- Advantages
 - Simplified clipping in homogenous coordinates
 - Extends to cases where we use homogenous coordinates to represent additional information (and w could be negative).
 - Can simplify visibility algorithms.
- Approach: clever use of homogenous coordinates

Further comments on the canonical frustum

 u_{min} , u_{max} , v_{min} , v_{max} , are thought of as being in the camera coordinate system ==> units are that of world coordinate system

For assignment three, you need to choose u_{min} , u_{max} , v_{min} , v_{max} , and f.

Note the reciprocal relation of u_{min} , u_{max} , v_{min} , v_{max} , and f.

For assignment three, I suggest u_{min} , u_{max} , v_{min} , v_{max} , reflect the aspect ratio of your screen window, and set f accordingly.

Further comments on the canonical frustum

Once you have screen (x,y) you need to map them back to the screen coordinates. The canonical frustum gives the screen as a square that is 2f' by 2f'.

$$\hat{x} = x \bullet \frac{u_{\text{max}} \square u_{\text{min}}}{2f} = X \bullet \frac{f}{\square Z} \bullet \frac{u_{\text{max}} \square u_{\text{min}}}{f} = X \bullet \frac{u_{\text{max}} \square u_{\text{min}}}{\square Z}$$

$$\hat{y} = y \bullet \frac{v_{\text{max}} \square v_{\text{min}}}{2f} = Y \bullet \frac{f}{\square Z} \bullet \frac{v_{\text{max}} \square v_{\text{min}}}{f} = Y \bullet \frac{v_{\text{max}} \square v_{\text{min}}}{\square Z}$$

Notice that f has disappeared from the RHS.

Recall that the mapping to the canonical frustum used the relation between the window size and f was used in them mapping.

Further comments homogenous coordinates

H.C.'s add a dimension.

All points that **project** onto the same point on a generalized plane (same dimension as original space) in the H.C. space are the **same**.

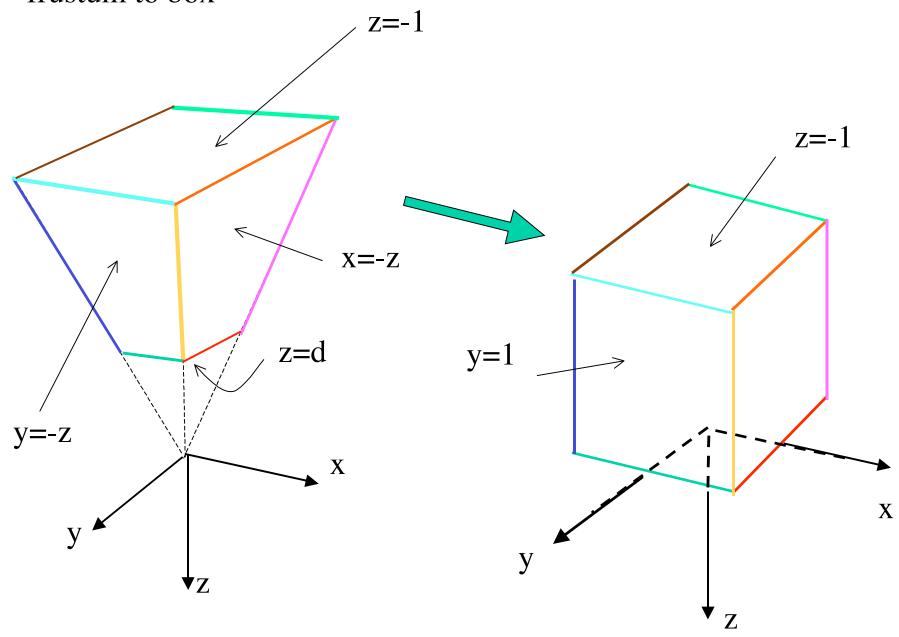

In this course we use the plane???

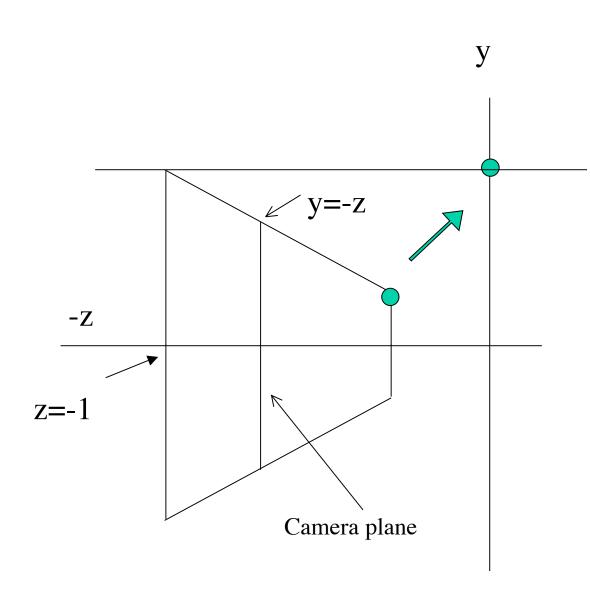

Further comments homogenous coordinates

H.C.'s add a dimension.

All points that **project** onto the same point on a generalized plane (same dimension as original space) in the H.C. space are the **same**.

In this course we use the plane w = 1

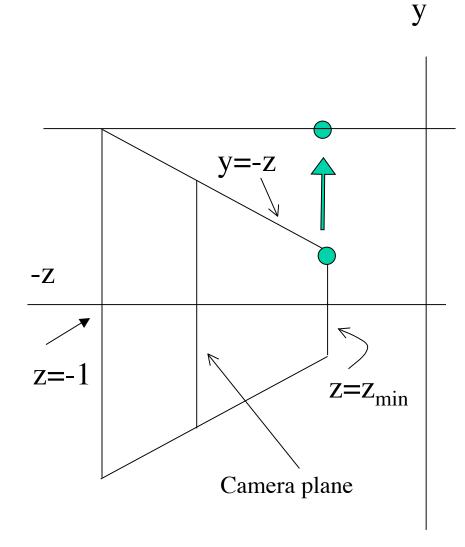

Do this in two steps. One stretch in y (and x), and on stretch in z.

y=-z $-\mathbf{Z}$ z=-1 $z=z_{min}$ Camera plane

The picture should suggest an appropriate scaling for y.

It is?

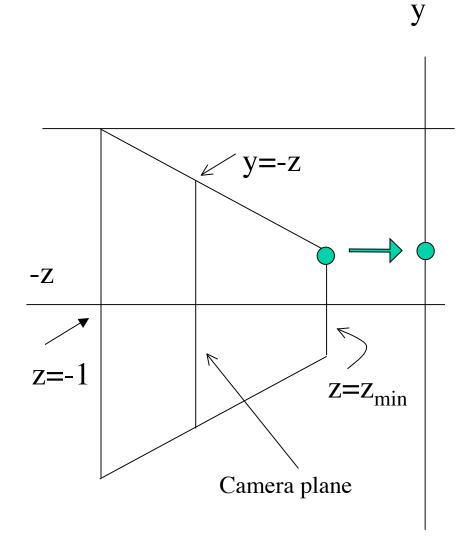

On top, $y \rightarrow 1$, so scaling is (1/y)Recall that y=-z there.

On bottom, $y \rightarrow -1$ so scaling is (-1/y). Recall that y=z there.

So scaling is y' = y/(-z)

Similarly, x' = x/(-z)

Transformation is **non-linear**, but in h.c., we can make w = (-z).

For z, we translate near plane to origin. But now box is too small. Specifically it has z dimension $(1 \square z_{min})$ (recall z_{min} is negative)

So we have an extra scale factor $1/(1+z_{min})$ and thus $z'=(z-z_{min})/(1+z_{min})$

But we want x and y to work nicely in h.c., with w=-z, so we use

$$z' = ((z - z_{min}) / (1 + z_{min}))/(-z)$$

(Thus in our box, depth transforms **non-linearly**)

In h.c.,

$$x=>x$$
 $y=>y$
 $z=>(z - z_{min}) / (1 + z_{min})$
 $1=>-z$

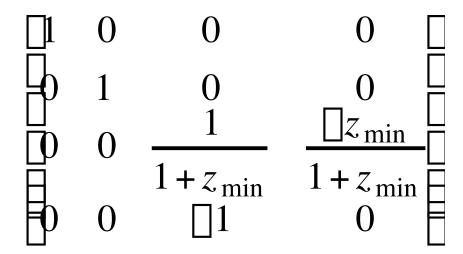

So, the matrix is

In h.c.,

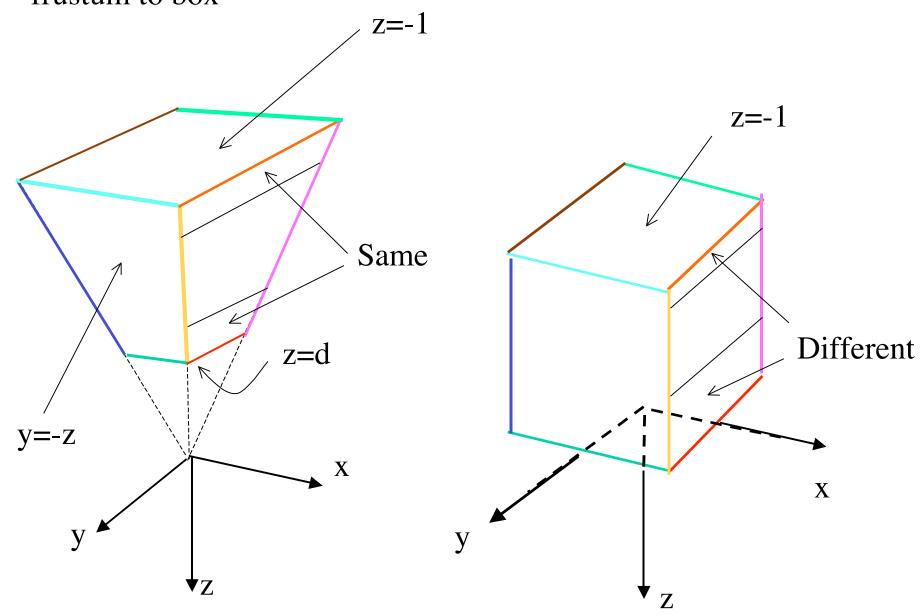

$$x=>x$$
 $y=>y$
 $z=>(z - z_{min}) / (1 + z_{min})$
 $1=>-z$

So, the matrix is

Mapping to standard view volume (additional comments)

- The mapping from $[z_{min}, -1]$ to [0,-1] is non-linear. (Of course, there exists a linear mapping, but not if we want everything else to work out nicely in h.c.).
- So a change in depth of \triangle D at the near plane maps to a larger depth difference in screen coordinates than the same \triangle D at the far plane.
- But order is preserved (important!); the function is monotonic (proof?).
- And lines are still lines (proof?) and planes are still planes (important!).

Clipping in homogeneous coordinates

- We have a cube in (x,y,z), but it is **not** a cube in homogeneous coordinates, so we must divide if we want to take advantage of this particularly nice clipping situation.
- However, dividing before clipping might be inefficient if many points are excluded, so we often clip in homogeneous coordinates.

Clipping in homogeneous coord.'s

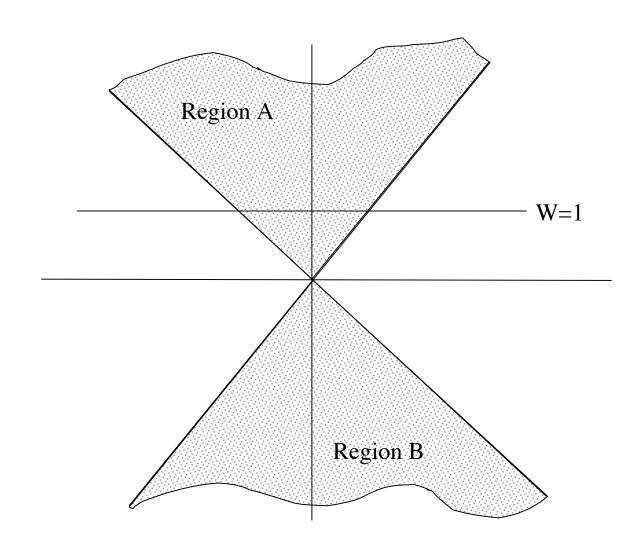

- Write h.c.'s in caps, ordinary coords in lowercase.
- Consider case of clipping stuff where x>1, x<-1
- Rearrange clipping inequalities:

$$\begin{array}{ll} \boxed{X} \boxed{>} 1 & X > W, & X < W, \\ \boxed{X} \boxed{>} 1 & X > W, & X < W, \\ \boxed{X} \boxed{>} 1 & X > W, & X < W, \\ \boxed{W} \boxed{>} 1 & X > W < 0 & X < W, \\ \boxed{W} > 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 & W < 0 &$$

(So far W is positive, but negatives occur if we further overload the use of h.c.'s)

Clipping in homogeneous coord.'s

The clipping volume in cross section

Clipping in homogeneous coord.'s

- If we know that W is positive (the case so far!), simply clip against region A
- If we are using the h.c. for additional deferred division, then W can be negative.
- If W is negative, then we use region B. The clipping can be done by negating the point, and clipping against A, due to the nature of A and B.
- Case where object has both positive and negative W is a little more complex.
- Notice that the actual clipping computations are not that different from the case in Plan A---no free lunch!
